

Press to Start: La evolución de los videojuegos

Medidas DAX usadas en Power BI:

1. Time Period: Para clasificar los registros por periodos de tiempo.

```
Time_Period =  
IF(  
    'df_cleaned'[Year_of_Release] <= 1994, "1980-1994",  
    IF(  
        'df_cleaned'[Year_of_Release] <= 2000, "1995-2000",  
        IF(  
            'df_cleaned'[Year_of_Release] <= 2007, "2001-2007",  
            "2008-2016"  
        )  
    )  
)
```

2. Top_Games: Calcula los 3 juegos más vendidos de cada género en cada uno de los periodos de tiempo.

```
Top_Games =  
VAR RankedGames =  
    ADDCOLUMNS(  
        FILTER(  
            'df_cleaned',  
            'df_cleaned'[Genre] = MAX('df_cleaned'[Genre]) &&  
            'df_cleaned'[Time_Period] = MAX('df_cleaned'[Time_Period])  
        ),  
        "SalesRank", RANKX(  
            FILTER(  
                'df_cleaned',  
                'df_cleaned'[Genre] = EARLIER('df_cleaned'[Genre]) &&  
                'df_cleaned'[Time_Period] = EARLIER('df_cleaned'[Time_Period])  
            ),  
            'df_cleaned'[Global_Sales],, DESC  
        )  
    )  
  
VAR Top3Games =  
    TOPN(3, RankedGames, 'df_cleaned'[Global_Sales], DESC)  
  
RETURN  
    CONCATENATEX(Top3Games, 'df_cleaned'[Name] & " (" & FORMAT('df_cleaned'[Global_Sales], "0.0") & "M)", ", ")
```
